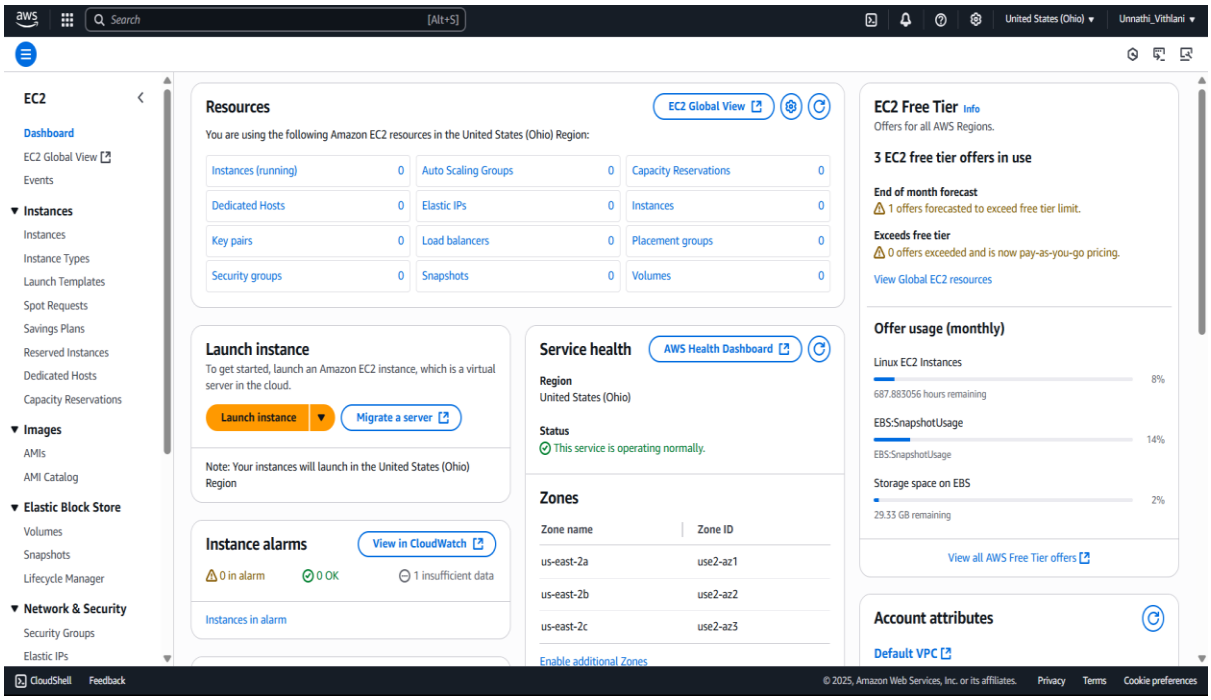
Lab 5: AWS EC2 Auto-scaling Lab

EXERCISE 10.1

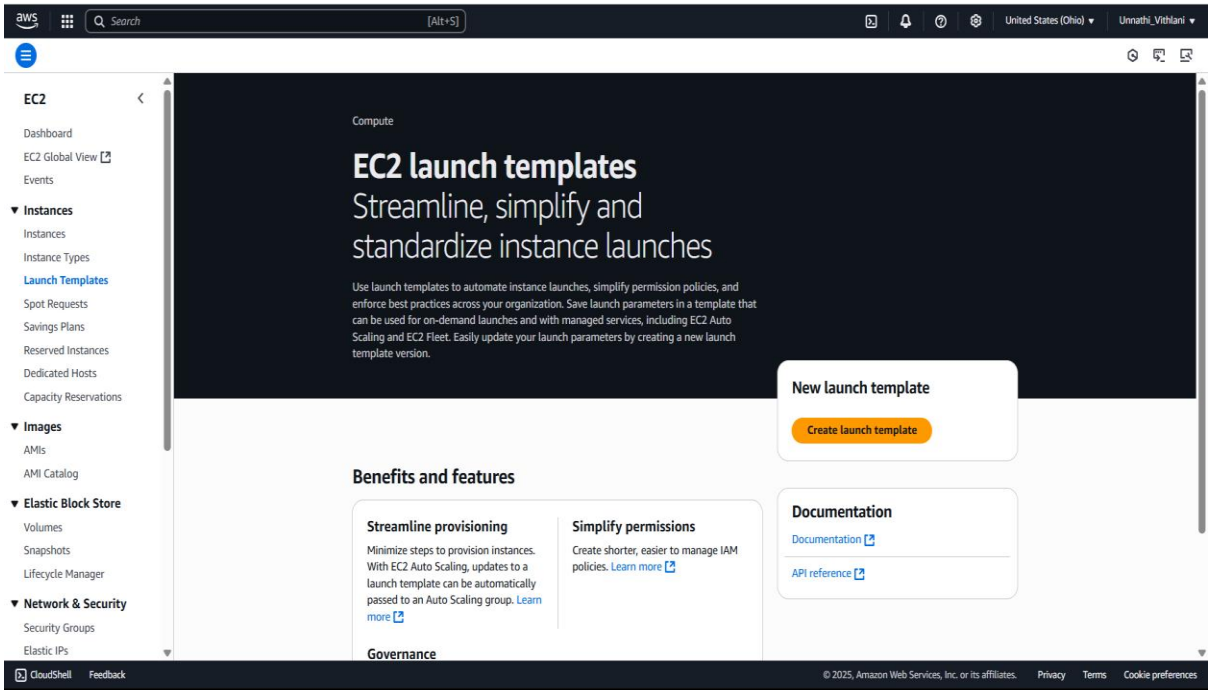
Create a Launch Template

In this exercise, you'll create a launch template that installs and configures a simple web server. You'll then use the launch template to manually create an instance.

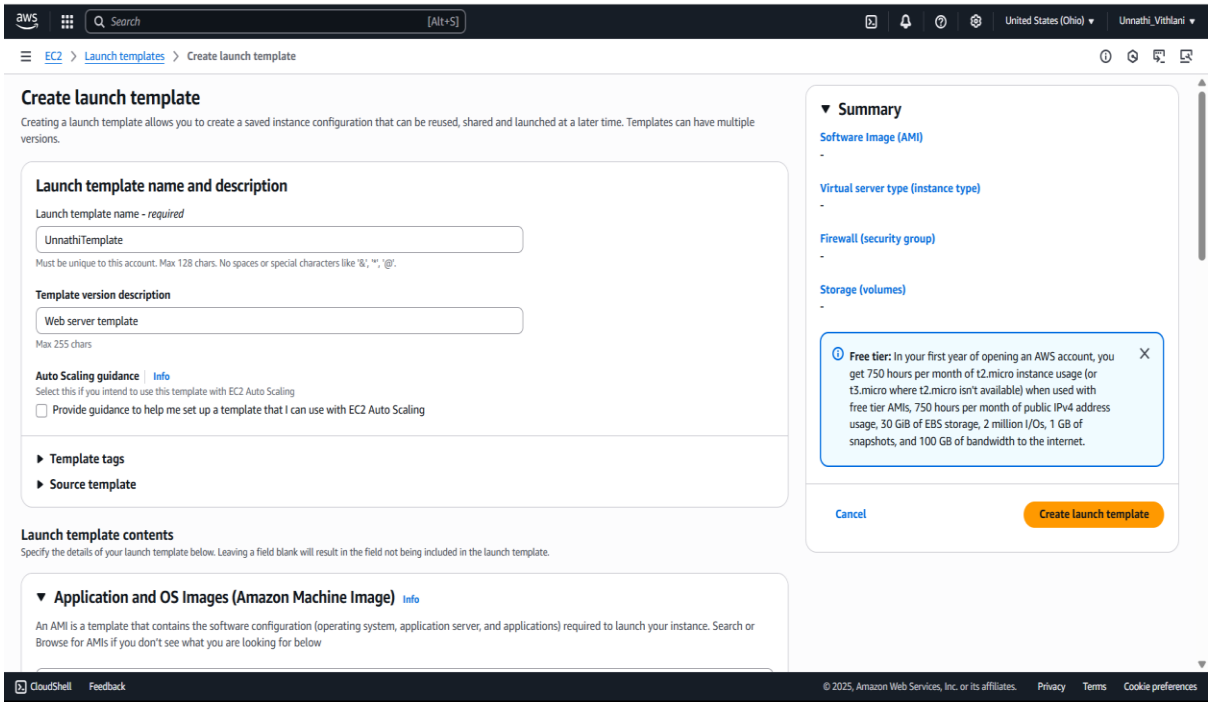
1. **In the EC2 service console, click Launch Templates.**



2. **Click the Create Launch Template button.**

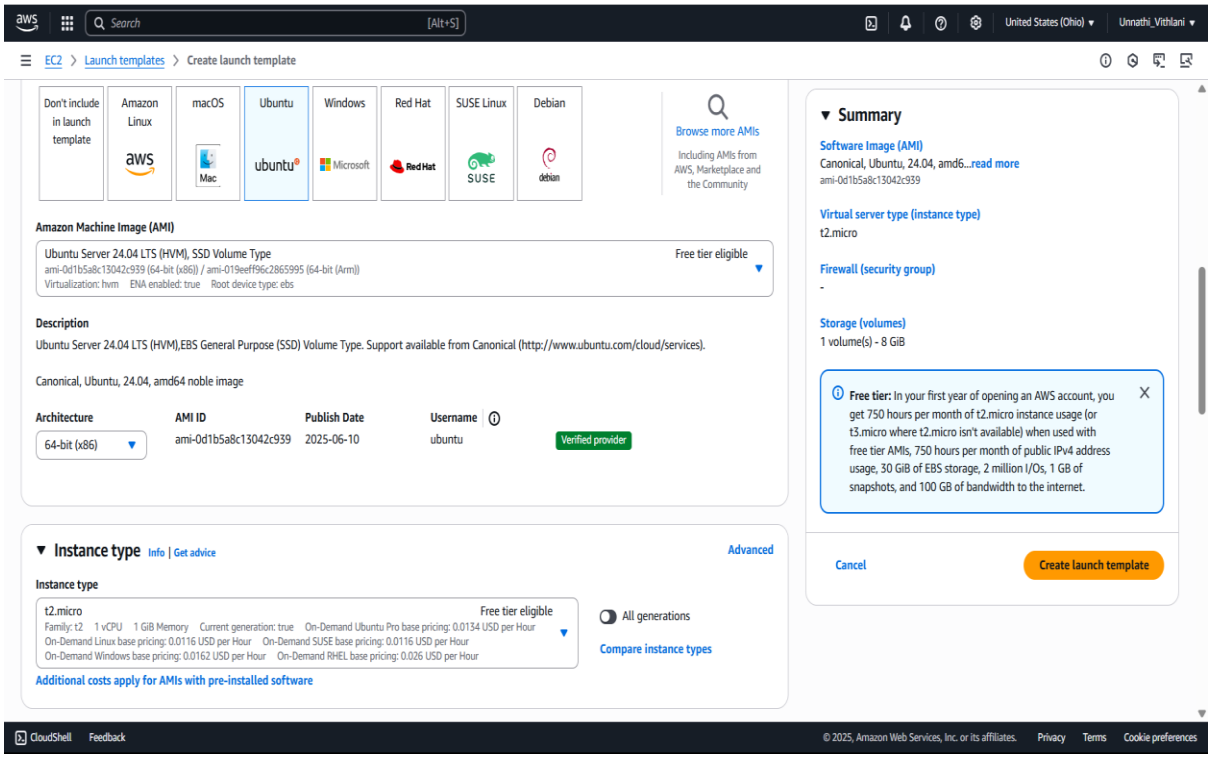


3. Give the launch template a name such as MyTemplate.

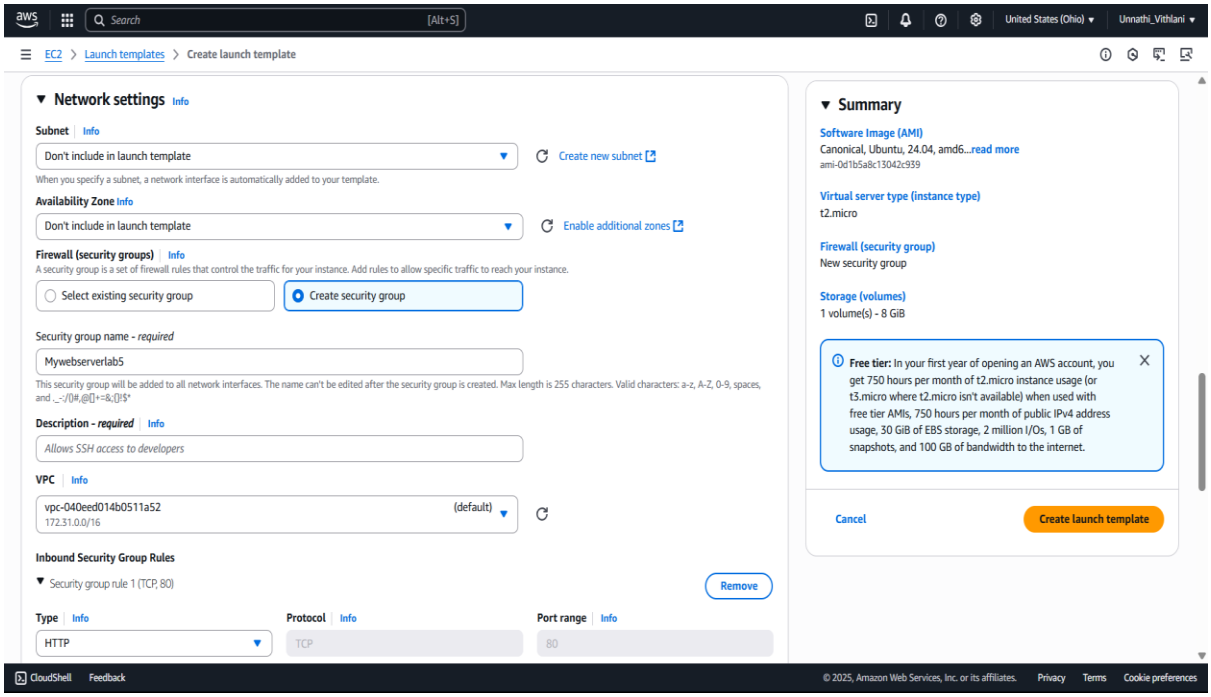


4. Click the Search For AMI link to locate one of the Ubuntu Server LTS AMIs. If you're in the us-east-1 region, you can use ami-0ac019f4fcb7cb7e6.

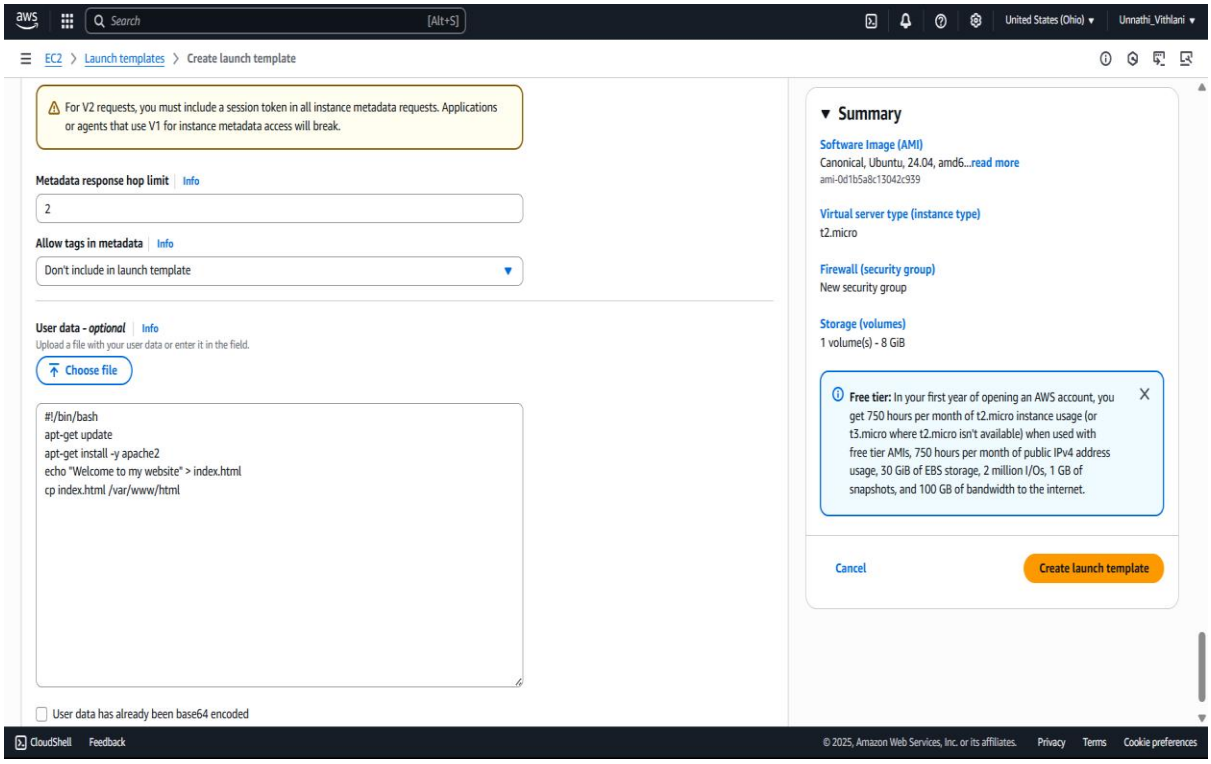
5. For Instance Type, select t2.micro.



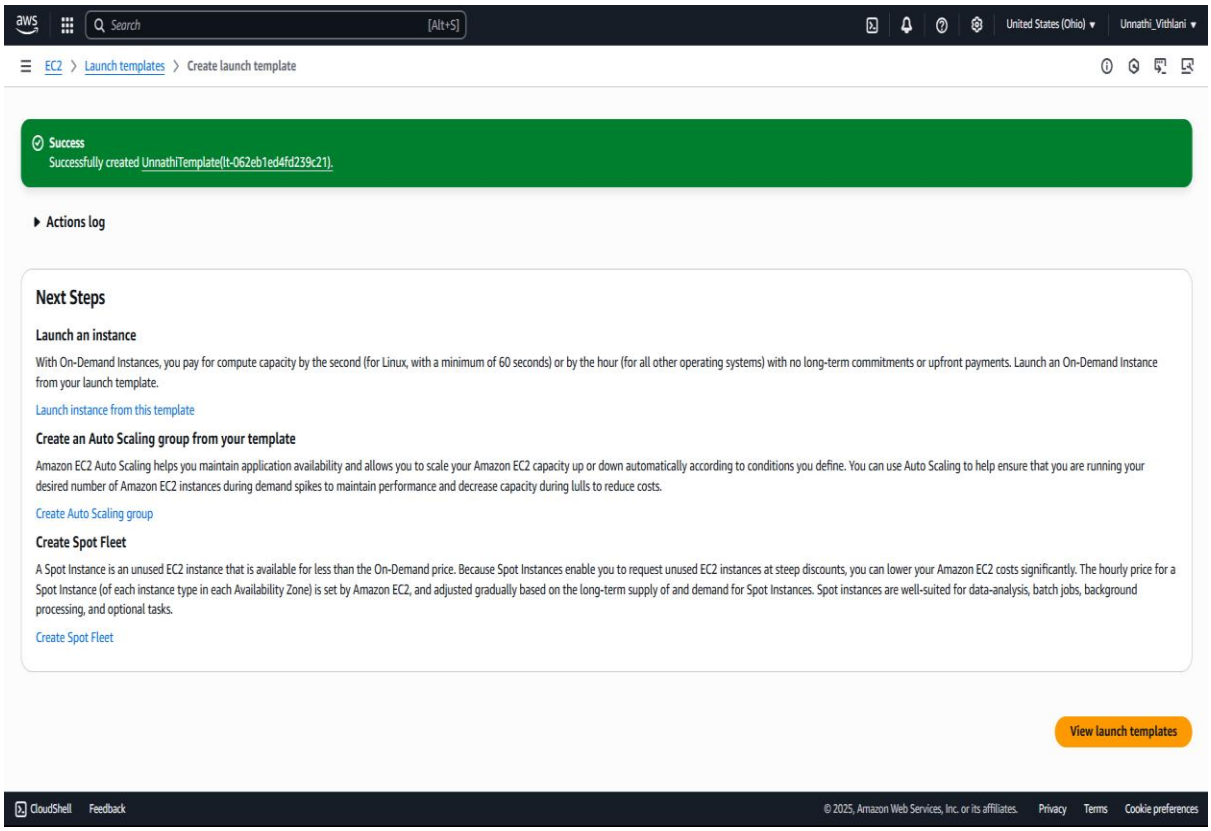
6. Under Security Groups, select a security group that allows inbound HTTP access. Create a new security group if necessary.

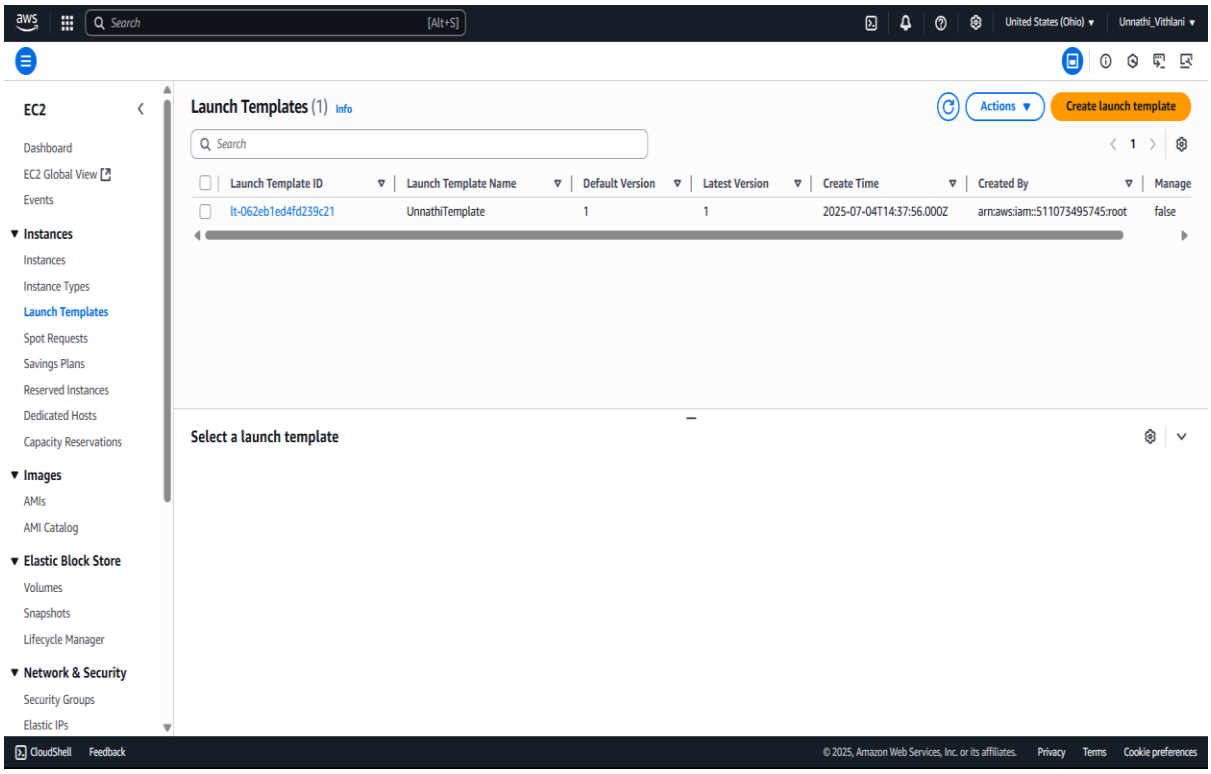


7. Expand the Advanced Details section and enter the following in the User Data text field:

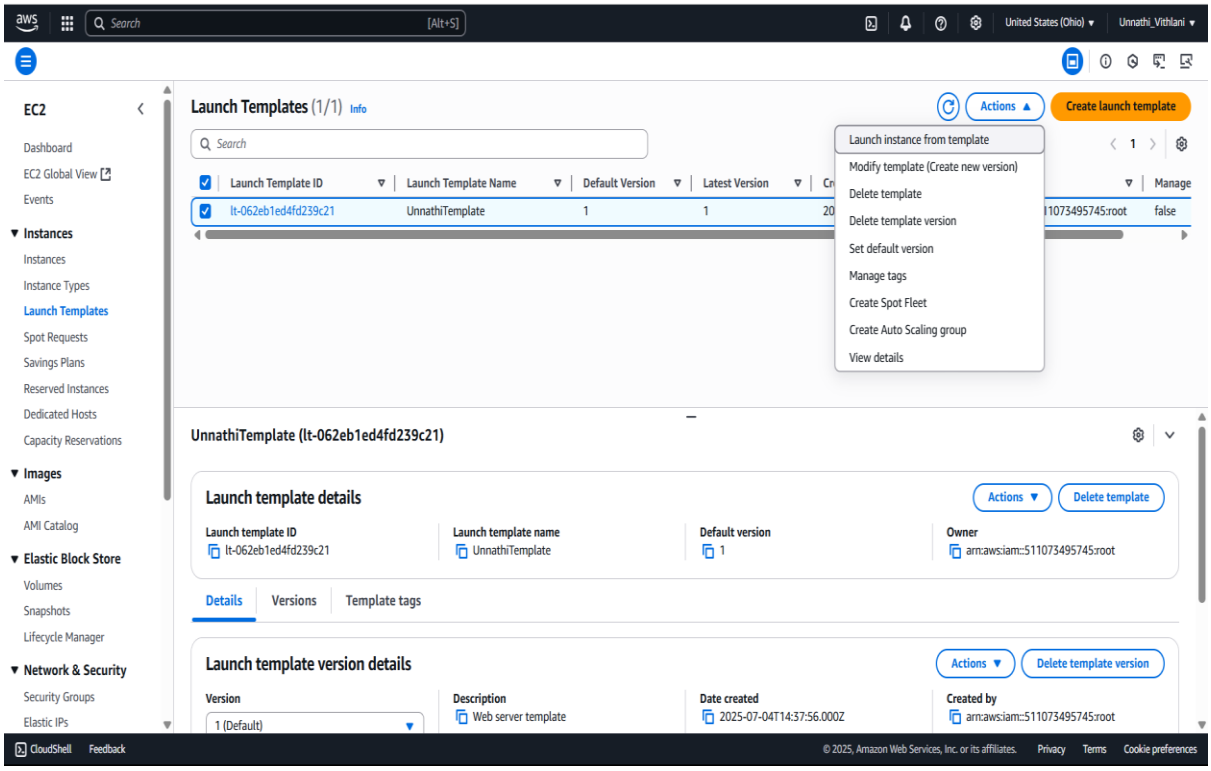


8. Click the Create Launch Template button.

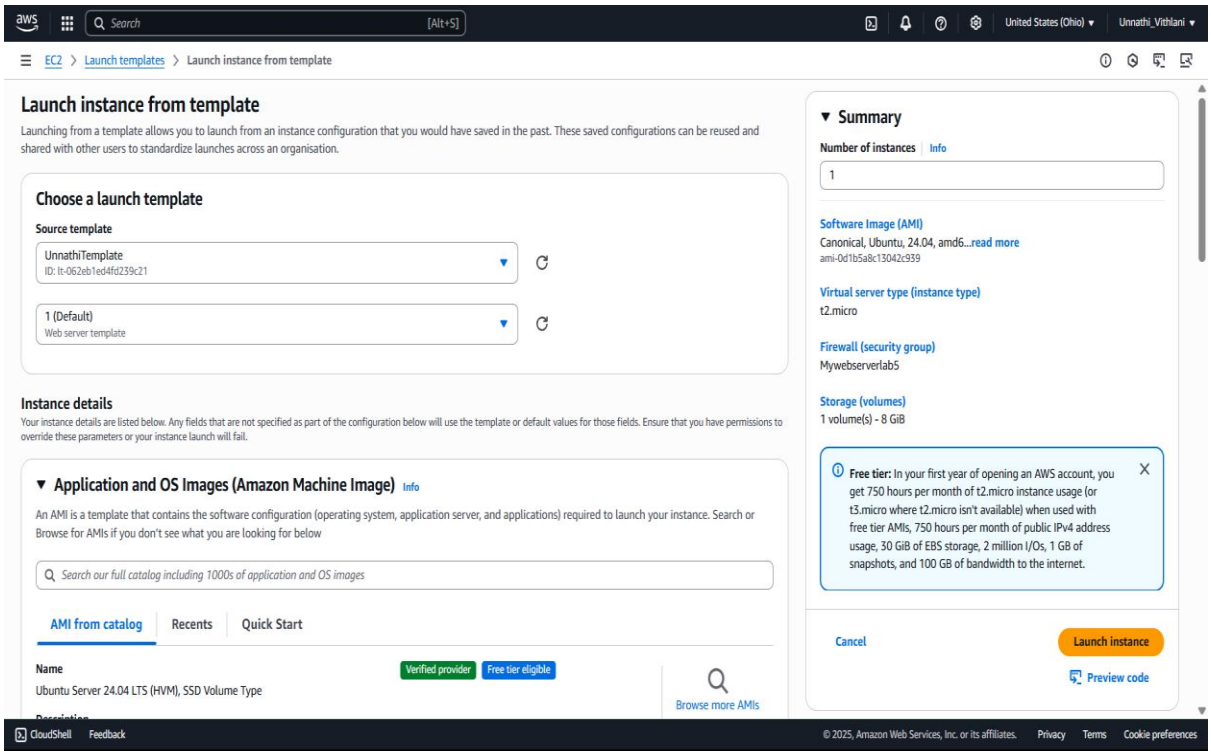




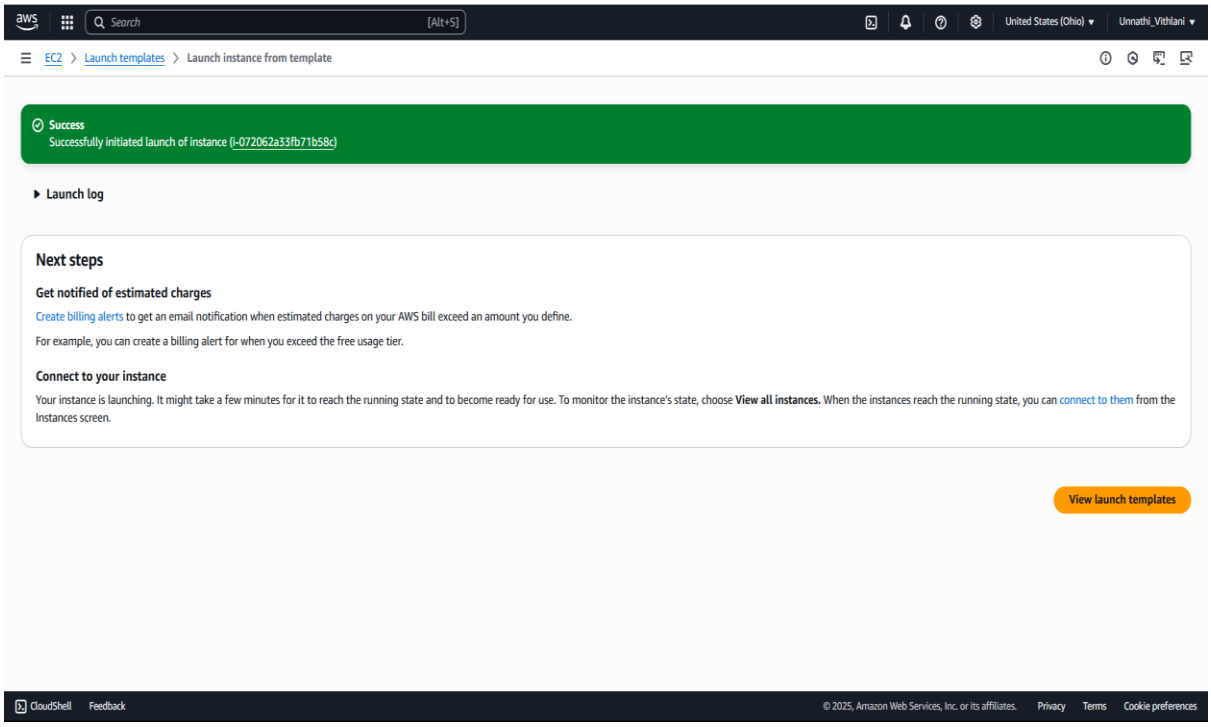
9. Click the Launch Instance From This Template link.



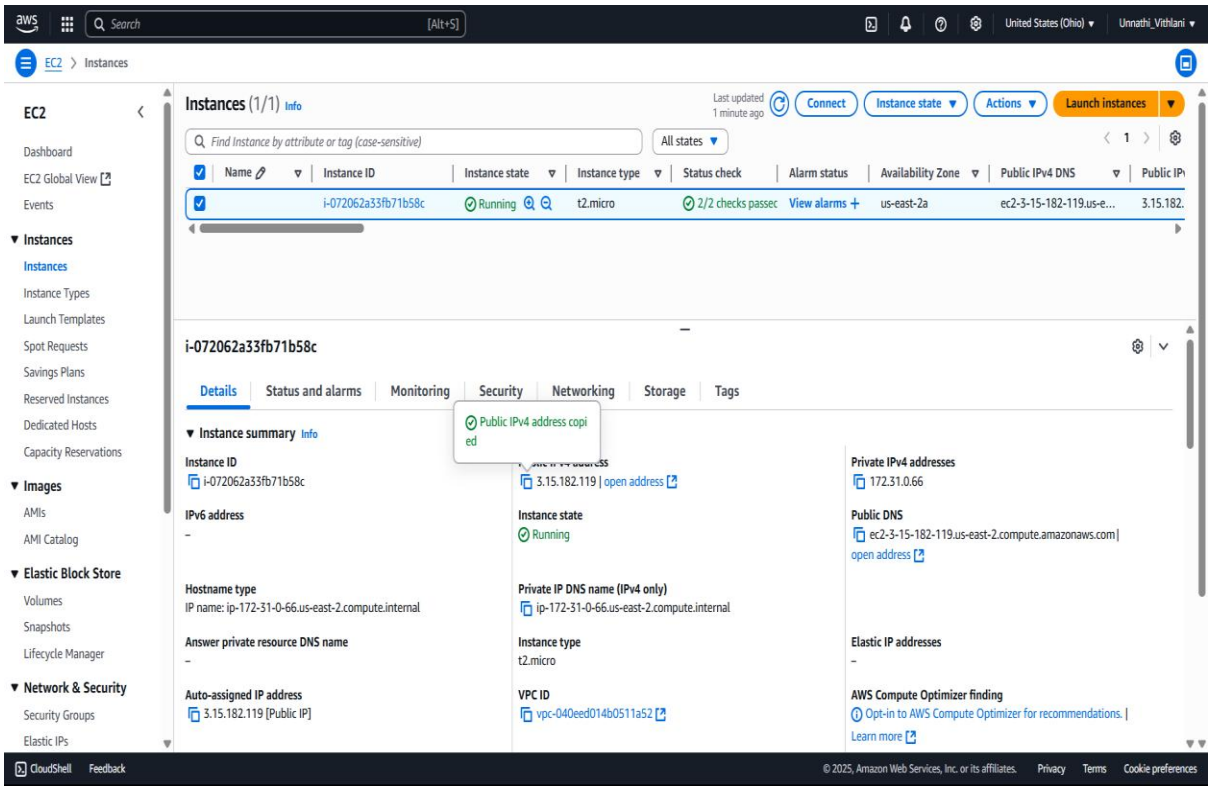
10. Under Source Template Version, select 1 (Default).

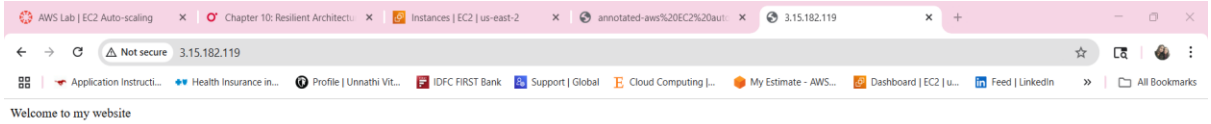


11. Click the Launch Instance From Template button.



12. After the instance boots, browse to its public IP address. You should see a web page that says "Welcome to my website."





13. Terminate the instance when you're done with it.
